                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The German cDNA consortium;
Submitted (NOV-2004) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Carboxypeptidase which converts angiotensin 1 to
angiotensin 1-9, a peptide of unknown function, and angiotensin II
to angiotensin 1-7, a vascadilator. Also able to hydrolyze apelin-
13 and dynorphin-13 with high efficiency. May be an important
regulator of heart function (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pongo pygmaeus (Orangutan).

COFACTOR: Binds 1 zinc ion per subunit (By similarity).
COFACTOR: Binds 1 chloride ion per subunit (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein. Processing by
ADAN17 may lead to a secreted protein (By similarity).
SIMILARITY: Belongs to the peptidase M2 family.
                                                                                                                                                                                                                                                                                               EMBL, CR857122; CAH89426.1; -; mRNA.

Submitted (MAR-2005) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Carboxypeptidase which converts angiotensin I to
angiotensin 1-9, a peptidase which converts angiotensin II to
angiotensin 1-7, a vasodilator. Also able to hydrolyze apelin-
13 and dynorphin-13 with high efficiency. May be an important
regulator of heart function (By similarity).
-!- COFACTOR: Binds I zinc ion per subunit (By similarity).
-!- COFACTOR: Binds I chloride ion per subunit (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein. Processing by
ADAM17 may lead to a secreted protein (By similarity).
-!- SIMILARITY: Belongs to the peptidase M2 family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -I-FUNCTION: Carboxyperidase which converts angiotensin I to angiotensin 1-9, a peptide of unknown function, and angiotensin II to angiotensin 1-9, a vasodilator. Also able to hydrolyze apelin-
13 and dynorphin-13 with high efficiency. May be an important regulator of heart function.
-I-COFACTOR: Binds I zinc ion per subunit (By similarity).
-I-COFACTOR: Binds I chloride ion per subunit (By similarity).
-I-ENZYME REGULATION: Activated by chloride and fluoride, but not bromide. Inhibited by MIN-4760, CFP Leu, and BDTA, but not by the bromide. Inhibited by MIN-4760, CFP Leu, and BDTA, but not by the ACE inhibitors linosipril, captopril, enalaprilat.
-I-SUBCELLULAR LOCATION: Type I membrane protein. Processing by ADAM17 may lead to a secreted protein (By similarity).
-I-TISSUE SPECIFICITY: Expressed in heart, kidney and forebrain. In testis, expressed in endothelial cells from small and large arteries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This Swiss-Prot entry is copyright. INDUCTION: Down-regulated in lung after acute injury.

MISCELLANEOUS: Mice lacking ACES are viable and fertile, exhibit normal kidney and lung function, but show a severe reduction in cardiac contractility, and are highly sensitive to severe acute lung failure. Transgenic mice overexpressing ACES in the heart appear healthy but show conduction disturbances and ventricular arrhythmias which can lasd to sudden death.

CAUTION: Ref. il (BAB40431) sequence differs from that shown due to a frameshift in position 784.

Submitted (MAY-2005) to the EMBL/GenBank/DDBJ databases.

-up function converts angiotensin I to angiotensin II by release of the terminal His-Leu, this results in an increase of the vasoconstrictor activity of angiotensin. Also able to inactivate bradykinin, a potent vasodilator (By similarity).

-up caralyric Activity: Release of a C-terminal dipeptide, oligopeptide-| *Asa-Ysa, when Xsa is not Pro, and Ysa is neither Asp nor Glu. Thus, conversion of angiotensin I to angiotensin II, with increase in vasoconstrictor activity, but no action on

"Structural details on the binding of antihypericansive drugs captopril

and enalaprilat to human testicular angiotensin I-converting enzyme.";

Biochemistry 43:8718-8724(2004).

I FUNCTION: Converts angiotensin I to angiotensin II by release of the the terminal His-Leu, this results in an increase of the vasoconstrictor activity of angiotensin. Also able to inactivate bradykinin, a potent vasodilator. Has also a glycosidase activity which releases GPI-anchored proteins from the membrane by cleaving the mannose linkage in the GPI modety.

C.I. GATALYTIC ACTIVITY: Release of a C-terminal dipeptide,

C.I. GATALYTY (ACTIVITY: Release of a C-terminal dipeptide).

C.I. CATALYTON TOWNSTION of angiotensin I to angiotensin II, with increase in vasoconstrictor activity, but no action on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PubMed=12459472;

"Patterns of single-nucleotide polymorphisms in candidate genes for blood-pressure homeostasis.";

I Nat. Genet. 22:339-247(1939).

-! FUNCTION: Converts angiotensin I to angiotensin II by release of the terminal His-Leu, this results in an increase of the vasconstrictor activity of angiotensin. Also able to inactivate bradykinin, a potent vasodilator.

-! CATALVIIC ACTIVITY: Release of a C-terminal dipeptide, oligopeptide-|-Xaa-Yaa, when Xaa is not Pro, and Yaa is neither Asp nor glu. Thus, conversion of angiotensin II, with increase in vasoconstrictor activity, but no action on angiotensin II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isold=P12821-1; Sequence=Displayed;
Name=Testies-specific;
Isold=P22966-1; Sequence=External;
-!- TISSUE SPECIFICITY: Ubiquitously expressed, with highest levels in lung, kidney, heart, gastrointestinal system and prostate.
-!- INDUCTION: Up-regulated in failing heart.
-!- PTM: Phosphorylated by CK2 on Ser-1299; which allows membrane
